

# Stack DS

# Introduction

- A list for which Insert and Delete are allowed only at one end of the list (the *top*)
  - **LIFO – Last in, First out**

# What is Stack Good For?

- Page-visited history in a Web browser
- Undo sequence in a text editor

# Stack ADT

## Objects:

A finite sequence of nodes

## Operations:

- **Create**: Create a list for stack and decide the size
- **Push**: Insert element at top
- **Top / Peek**: Return top element
- **Pop**: Remove and return top element
- **isFull**: test if stack is full
- **isEmpty**: test if stack is empty

# Stack – Implementation

- Initialization:
  - Top = -1 (To have the index of the last element inserted)
  - Max = n (To fix the size of the stack)

```
isFull(stack){  
    return (top == MAX-1)  
}
```

```
isEmpty(stack){  
    return (top == -1)  
}
```

# Push and Pop

# Algorithm for push

```
Push(stack, data) {  
    if (!isfull(stack))  
        top = top + 1  
        stack[top] = data  
    else  
        print("Stack Full")  
}
```

# Algorithm for Pop

```
Pop(stack) {  
    if (!isEmpty(stack))  
        data ← stack[top]  
    top ← top - 1  
    return data  
    else  
        print("Empty Stack")  
}
```

# Display and Peek Functions

```
Display(stack) {  
    if(isEmpty())  
        cout<<"Stack underflow";  
    else  
        for(i=0;i<=top;i++)  
            cout<<stack[i];  
}
```

```
Peek(stack) {  
    if(isEmpty())  
        cout<<"Stack underflow";  
    else  
        return(stack[top]);  
}
```
